Rotate, Flip, Crop, Convert and Resize images

Uses Windows Image Acquisition (WIA) via OleAutoClient.

WIA is free and is distributed with most versions of Windows.

Tested in both PLUS 2.80 and PLUS 12.3

Thanks to Bernard Mouille for his help in figuring out a workaround for a bug in dBASE that prevented stacking commands.

Uses WIA to change image file types.

Can convert "BMP|PNG|GIF|JPG|TIF"

Also allows you to Rotate, Flip, Crop, and Resize images

See examples for more details on using each function.

This is just the CC and its associated H file.

Examples of use are in the header of the WIA.CC

If anyone needs additional examples for a function, post up.

With a little modification you can probably expand the CC for additional functionality.

This CC is another example of how you can expand the capabilities of dBASE using OleAutoClient and some of Windows native COM objects.
